OTT Release Radar · From "What came out this week?" to a Friday Telegram Digest — Components Map

How to read this page: start at box 1 and follow the numbers and the dashed arrows. A timer fetches this week's new releases, a second service confirms where each title streams, the app keeps only what matches your profile, the AI adds opinions, and the result reaches you on the website and in Telegram. The coloured tag on each box names the tool doing that step.

What kicks it off · What goes in · Rules it follows · What the app does · What the AI adds · What you get

Tools behind the app

TMDB	Movie and TV library: what released, when, and the artwork
RapidAPI	Tells us which streaming apps carry a title in India
Google Gemini	The AI that writes the short Watch / Skip opinions (never facts)
Neon	Database: the app's long-term memory for releases, filters and Likes
Vercel	Runs the website live on the internet and wakes the app on schedule
GitHub	Keeps the program code safe and tracks every change
Telegram	The chat app that receives your Friday digest
Next.js	The toolkit the website itself is built with

How to try it

Step 1	Open the website and sign in with the PIN
Step 2	Open **Profile** and pick your genres, languages and platforms
Step 3	Open **New Releases** to see this week's matching titles
Step 4	Press **Send This Week's List Now**: the digest arrives in Telegram

Friday time range: each Friday digest covers releases from the **previous Friday 6:01 PM up to Friday 6:00 PM, India Standard Time (IST)**, both ends included. A platform name is shown only when it is confirmed. Good to know: Likes and Dislikes only change the **Personalized for You** list; the **Recommended for Your Filters** list never uses them. Release dates are calendar dates from TMDB (no exact time), so a title counts in the week its date falls in. The AI gives opinions only; every date, platform and runtime comes from TMDB and RapidAPI.
