OTT Release Radar - From "What came out this week?" to a Friday Telegram Digest - Components Map

Follow the numbers and the dashed arrows: a timer wakes the app, it fetches this week's releases, checks where they stream, keeps only what matches **your** filters, asks the AI for opinions, and shows the result on the website and in Telegram. The small label in each box is the application doing that step.

Applications used	
TMDB	A huge online movie and TV library. Tells us what released, when, and the artwork
RapidAPI	A service that tells us which streaming apps carry a title in India
Google Gemini	The AI that writes the short Watch / Skip opinions (it never supplies facts)
Neon	The database: the app's long-term memory for releases, filters and Likes
Vercel	Runs the website live on the internet and wakes the app up on schedule
GitHub	Keeps all the program code safe and versioned
Telegram	The chat app that receives your Friday digest
Next.js	The toolkit the website itself is built with

How to try it	
1	Open the website and sign in with the PIN
2	Open **Profile** and pick your genres, languages and platforms
3	Open **New Releases** to see this week's matching titles
4	Press **Send This Week's List Now**: the digest arrives in Telegram

Good to know: Likes and Dislikes only change the **Personalized for You** list; the **Recommended for Your Filters** list never uses them. Release dates are calendar dates from TMDB (no exact time), so a title is counted in the week its date falls in. The AI gives opinions only; every date, platform and runtime comes from TMDB and RapidAPI.
